ABOUT ME

Computer Science undergraduate with hands-on experience in Software and backend development, and API design. Strong foundation in Java, Python, object-oriented programming, data structures, databases, and problem-solving. Experienced in building scalable applications and automating workflows using clean, maintainable code.

SKILLS

- **Languages:** Java, Python, SQL, C/C++, HTML, CSS, JavaScript | **Databases:** MongoDB, MS SQL
- **Backend & Systems:** Springboot, Flask, FastAPI, REST API Development, API Testing (Postman)
- **AI/ML:** PyTorch, Transformers, NumPy, Pandas, LLM Integration | **Tools:** Linux, Git

EXPERIENCE

SDE Intern (Flask, FastAPI, MongoDB, LLMs, API Design)

Tactlabs Pvt. Ltd | Toronto, Canada

Aug 2023 - Apr 2024

- Engineered 5+ backend APIs using Flask and FastAPI for automated test case generation, cutting manual effort by ~60% per testing cycle.
- Integrated GPT-2 via Hugging Face Transformers and PyTorch to generate Postman-compatible test cases, achieving ~80% structural accuracy on 200+ test prompts.
- Architected scalable data pipelines with MongoDB and JSON-based API structures.

Web Development Intern (HTML, CSS, JavaScript)

Plasmid Pvt. Ltd | Chennai

Jul 2024 - Sept 2024

- Improved frontend responsiveness and backend functionality across 4+ web modules, reducing reported UI issues by ~30%
- Built responsive design layouts from scratch and integrated back-end endpoints for 2 client-facing features

Developer Intern (SQL, Backend Systems, Data Workflows, SAP BI)

Indus Novateur Software Pvt. Ltd | Coimbatore

Jun 2025 - Jul 2025

- Configured master data, mapped document flows, and customized UDFs across 4+ core SAP Business One ERP modules.
- Resolved 10+ workflow inconsistencies during deployment, ensuring reliable data propagation across transaction lifecycle.

PROJECTS

Automatic Testcase Generator- Postman Compatible (Python, Flask, Transformers, GPT-2, PyTorch, REST API, JSON)

- Built an AI-powered tool that generates Postman-compatible API test cases from natural language prompts, reducing manual test authoring time by ~65% in internal trials.
- Engineered the backend using Flask and integrated GPT-2 with Transformers and PyTorch, enabling NLP-driven test automation across 3 API endpoint types

AI DNA Mutation Prediction (Python, TensorFlow/PyTorch, CNN-LSTM, FastAPI, NumPy)

- Designed DeepMorph, a hybrid CNN-LSTM multi-task learning system for DNA sequence analysis, predicting mutation status, gene classification, and clinical significance across 3 output tasks using one-hot encoded inputs.
- Deployed an end-to-end inference pipeline with FastAPI, enabling REST-based risk-level interpretation and structured genomic output — reducing manual classification effort by ~50%

Webhook Delivery Engine (Java, Spring Boot, JPA, REST API, MySQL)

- Built an async event fan-out engine delivering HTTP POST webhooks to subscribers with per-attempt tracking across a 4-table schema
- Configured exponential backoff retry (3 attempts, 30/60/120s) via Spring Scheduler with full SQL-persisted delivery audit logs

Blockchain-Based Voting System (Solidity, Ethereum, Hardhat, Smart Contracts)

- Built a decentralized voting application using Solidity smart contracts, deployed and tested on the Ethereum blockchain with Hardhat — achieving 0 double-votes across 100+ simulated transactions.
- Enforced single-vote-per-address integrity, dynamic party creation, and real-time on-chain vote tallying with tamper-proof records.

RESEARCH PUBLICATION

Automating REST API Postman Test Cases Using LLM

Published on arXiv (Apr 2024). Developed a method to automatically generate REST API test cases using large language models, improving testing efficiency and reducing manual effort.
